

Facilities

We have a wide range of equipment to aid diagnosis and treatment. This includes:

- Ultrasound machine for pregnancy diagnosis and investigation of heart and abdominal problems
- Digital xray developer for superior quality xrays
- ECG machine for investigation of heart problems
- Blood pressure monitor
- Flexible endoscope to investigate gastrointestinal or chest problems
- Rigid endoscope for investigation of nasal problems
- Air driven dental drill and ultrasonic descaler for top quality dental treatment
- Extensively equipped laboratory to reach a diagnosis and treatment plan faster

Laboratory tests that can be run in house include pre-anaesthetic profile, full general health profile including electrolytes; haematology, coagulation assays, ringworm culture, microscopy of skin scrapings and smears etc. We always endeavour to inform clients of laboratory results as quickly as possible and ideally the same day that we receive them.

For hospitalised patients, we have modern infusion pumps and a syringe driver to allow for accurate administration of intravenous fluids and drugs. We also have an oxygen tent to help patients who are experiencing difficulty breathing.

Our operating theatres are supplied by piped anaesthetic gases to ensure reliable delivery. We are also fortunate to have separate theatres for soft tissue surgery, orthopaedic procedures and dirty procedures such as dental work.
